

BEconneCTD-ILD

**Adults with
interstitial lung
disease needed
for a research
study**

If an autoimmune disease has damaged your lungs, you may wonder if there are any other options for you.

Doctors are conducting a research study in the hopes of finding a new way to treat adults with interstitial lung disease.

If you have been diagnosed with rheumatoid arthritis, systemic lupus erythematosus, polymyositis, dermatomyositis, antisynthetase syndrome, Sjogren's syndrome, or mixed connective tissue disease, and have interstitial lung disease, you may qualify for the study.

Participants in the study will receive the study drug or the placebo added to their current standard therapy, with regular tests and doctor visits at no cost to them.
